## Project - Song Features Recommender

Classification problem: We will allow the user to select and rate certain features of a song such as tempo, loudness, and energy to predict the danceability score. For example, we will have drop down menus of song features that will allow the user the rate. Based off the combination of scores, we will use SkLearn and LinearRegression machine learning models to predict the danceability rating. From there, we will filter and display songs based off of that danceability score.
